

LATIN AMERICAN PERSPECTIVES

Political Ecology, Gender, and the Environment in Latin America

We are pleased to announce the release of our January 2026 Issue:

Volume 53, Number 1 — now available online.

This special issue brings together cutting-edge research on political ecology, gender, and the environment in Latin America, highlighting the central role of women in confronting socio-environmental crisis across the region. Drawing on interdisciplinary approaches, the contributions examine how extractivism, climate change, and resource conflicts produce unequal and deeply gendered impacts.

Across diverse case studies—from Colombia and Chile to Bolivia and Peru—the articles foreground the leadership, knowledge, and everyday practices of Indigenous, Afro-descendant, and campesina women. Together, they illuminate how struggles over land, water, and territory are also struggles over care, social reproduction, and political power. This issue offers a timely and critical exploration of feminist political ecology and the possibilities for resistance and transformation in the face of intensifying environmental and social inequalities.
