

A Call for Entries: Infrastructure Projects That Could Change Cities

Resilience-building infrastructure are robust and provide redundancy, but they are also integrated and developed through a reflective and inclusive process. When infrastructure projects are carefully conceived to cut across multiple sectors, and involve the community, their impact is exponential, making them fundamental building blocks of more resilient cities and societies.

That’s why we’re working with our partner AECOM to recognize resilience-building infrastructure projects – 10 projects globally that are either underway or completed, and 10 shovel-ready projects in the United States – that have these qualities and can address the most pressing challenges of our time. These projects lay the foundation for the next generation of economic development, environmental shifts, and population change.
